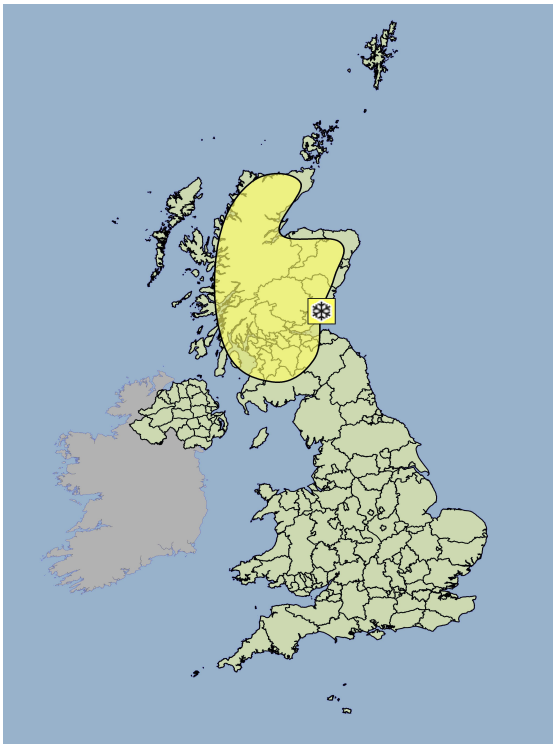
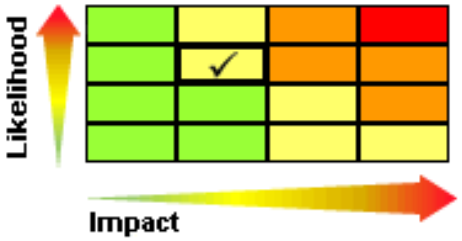
National Severe Weather Warning Service





Chief Forecasters Assessment
An area of low pressure is tracking across Scotland, bringing more widespread sleet or snow to the north of the low centre for a few hours on Sunday. The southern limit of this wintry threat is still not totally pinned down, given that there is a very sharp cut off between the cold air and much milder air in southern Scotland, with the intensity of the precipitation also playing a part - heavy precipitation can more readily turn to snow. On current evidence, the most likely areas to be affected by the more widespread snow would be Argyll, west Dunbartonshire, Stirlingshire, Clackmannanshire, Fife, Perth & Kinross and Angus.

From late Sunday afternoon onwards, a mix of wintry showers is expected, some heavy and still producing some tricky conditions overnight.

The Met Office have issued a **Yellow Warning** of **Snow**

Valid from **10:45 on Sun, 29th Nov 2015** until **10:00 on Mon, 30th Nov 2015**

Outbreaks of rain are now beginning to turn to snow in areas north of the Central Belt, the snow becoming heavy in places and locally persisting into Sunday afternoon, more especially in the north. This may bring a few cm of snow even to low levels, while 10-15 cm could accumulate over some high ground areas.

Following the clearance of the more general wintry precipitation, further clusters of heavy wintry showers will come in from the west, even extending to parts of southern Scotland on Sunday evening and at first on Sunday night, leading to further accumulating snow in places (especially the west Highlands). This will also bring an enhanced risk of ice into Monday morning.

Please be aware of the need to take extra care and allow more time for travel. Note that the
